

AgentTreasury Lite

A policy and evidence layer for autonomous USDC payments on Arc

**PUBLIC BUILD • TESTNET
ONLY**

Live demo • Public code • Verified Arc testnet evidence

Final submission • August 2026

ONCHAIN AGENT

ID 851421

Arc Testnet

Autonomous payments need an accountable control layer

THE RISK

An agent request alone is not a treasury decision.

Without policy checks, a payment cannot show why it was allowed, what reserve was protected, or who approved execution.

AGENTTREASURY LITE

Decide before the wallet asks for a signature.

✓ Recipient allowlist

✓ Spend cap

✓ Reserve floor

✓ Invoice reference

A human wallet confirmation remains the execution boundary.

Result: explainable decisions, explicit authorization, and auditable settlement evidence.

The demo turns requests into reviewable evidence

- 01**
REQUEST
Recipient, amount, invoice
- 02**
DECIDE
Policy approves or rejects
- 03**
AUTHORIZE
Human reviews in wallet
- 04**
RECORD
ArcScan receipt + audit log

LIVE DEMO

A small payment, a clear decision trail.

The browser checks the Arc network, connected wallet, spendable balance, recipient allowlist, payment cap, reserve floor, and invoice reference before a wallet can execute.

Private keys never leave MetaMask.

One policy layer, multiple independently verified primitives

FOUNDATION

Arc Testnet
USDC-denominated gas
Sub-second settlement

DECISION + EVIDENCE

AgentTreasury Lite

Policy checks + human
authorization boundary

VERIFIED OUTPUT

USDC App Kit Send
Structured memo
Public ArcScan receipt

ADDITIONAL VERIFIED EXPERIMENTS

These are separate testnet proofs; they are not presented as one combined browser transaction.

ArcMemo

Structured payment references

Multicall3From

Sender-preserving batch USDC

ERC-8004 identity

Official registry • Agent ID 851421

The project is live, inspectable, and still moving

LIVE DEMO

Public Vercel deployment
for reviewer access

851421

ERC-8004 Agent ID
owned by the project wallet

30/30

Automated tests passing
for the current build

OPEN EVIDENCE

Live demo

agent-treasury-lite.vercel.app

Code

A reviewer can inspect the build, testnet evidence, and next integration work in public.

Gateway / Nanopayments is a safe, evidence-first next step

TODAY

The prototype already controls and records payment decisions.

It has verified Arc testnet evidence, but it does not claim live Circle Gateway, x402, Nanopayments, or EIP-3009 settlement.

PLANNED ADAPTER

Preview authorization before settlement is introduced.

- ✓ Mock HTTP 402
- ✓ Policy review
- ✓ Deterministic reference
- ✓ No wallet signing

Gateway / Nanopayments remains explicitly labelled planned until official testnet evidence exists.

The roadmap keeps the integration honest: evaluate → authorize → settle → reconcile.

Real usage comes next — with the same evidence discipline

BUILT

- 01 Policy-gated payment demo
- 02 Arc testnet settlement evidence
- 03 ERC-8004 onchain identity
- 04 Public source, demo, and tests

NEXT

- 01 Add reviewer-friendly activity log
- 02 Validate an official payment adapter
- 03 Keep shipping public, testable increments

The project will prioritize genuine user value, explicit approval, and verifiable receipts over transaction volume.
